Outline

- Newton-Leibniz formula, product rule, chain rule
- Derivative of common functions
- Densities of common continuous distributions
- Integral by substitution
- Integral by parts

Theorem 1 (Newton-Leibniz formula) *Let $F(n)$ be one of the primitive function of $f(x)$, then*

$$\int_a^b f(x)dx = F(x)|_a^b = F(b) - F(a)$$

Theorem 2 (Product rule) *Let $h(x) = f(x)g(x)$, where $f, g \in C^0$, then $h'(x) = f'(x)g(x) + f(x)g'(x)$.*

Corollary 1 (Integral by parts) *$\int f dg = fg - \int g df$ holds when either side is finite.*

Theorem 3 (Chain rule) *Let $h(x) = f(g(x))$, where $f, g \in C^0$, then $h'(x) = f'(g(x))g'(x)$.*

Corollary 2 (Integral by substitution) *$\int_{[a,b]} f(g(x))g'(x)dx = \int_{[g(a),g(b)]} f(t)dt$ (Strictly speaking, we need some conditions, though you may never need to verify them in practice.)*

Family	primitive	derivative
Power	x^a	ax^{a-1}
Log	$ln(x)$	$\frac{1}{x}$
Exponential	e^x	e^x
Trigonometric	sin(x)	cos(x)
	cos(x)	-sin(x)

Table 1: Derivative of common functions

Distribution	density
Uniform $U(a, b)$	$1_{[a,b]}$
Normal $N(\mu, \sigma^2)$	$\frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$
Exponential $\mathcal{E}(\lambda)$	$\frac{1}{\lambda} e^{-\lambda x}$

Table 2: Densities of common continuous distributions

Example 1 (Mean of standard Normal) *Calculate $\int_0^\infty x e^{-\frac{x^2}{2}} dx$.*

Remark: $\int_{\mathbb{R}} x e^{-\frac{x^2}{2}} dx = 0$ for it's an odd function.

Example 2 (Double integral) *Calculate $\int_{\mathbb{R}} e^{-\frac{x^2}{2}} dx$.*

Example 3 (Variance of standard Normal) *Calculate $\int_{\mathbb{R}} x^2 e^{-\frac{x^2}{2}} dx$.*

Remark: So if we normalize the integral of $\int_{\mathbb{R}} e^{-\frac{x^2}{2}} dx$ by multiplying a coefficient $1/\sqrt{2\pi}$, it becomes a density function, which is exactly the density for standard normal. Besides, the result of Example 1 and 3 told us it has mean 0 and variance 1.
